Assignment No. 3

The Human Resources department needs a simple application to organize employee information.
Design an Employee class that stores employee details and enables authorized staff to view the stored
information whenever required.

```
#include <iostream>
#include <string>

using namespace std;

class Employee {
private:
    int id;
    string name;
    string department;
    double salary;

public:
    // Manual setup function to populate data
    void setDetails(int empId, string empName, string empDept, double empSal) {
        id = empId;
        name = empName;
        department = empDept;
        salary = empSal;
    }

    // Function to display employee info (authorized access)
    void displayInfo(bool authorized) const {
        if (authorized) {
            cout << "ID: " << id << "\n"
                 << "Name: " << name << "\n"
                 << "Department: " << department << "\n"
                 << "Salary: $" << salary << "\n"
                 << "--------------------------\n";
        } else {
            cout << "Access Denied: You are not authorized to view this record.\n";
        }
    }
};

int main() {
    // Using a standard fixed-size array instead of vector
```

```
    const int MAX_EMPLOYEES = 2;
    Employee staffList[MAX_EMPLOYEES];

    // Populating employee details manually
    staffList[0].setDetails(101, "Alice Smith", "HR", 55000.0);
    staffList[1].setDetails(102, "Bob Jones", "Engineering", 75000.0);

    // Simulate HR authorization check
    bool isAuthorizedHR = true;
    cout << "--- Employee Records (HR View) ---\n";
    for (int i = 0; i < MAX_EMPLOYEES; ++i) {
        staffList[i].displayInfo(isAuthorizedHR);
    }

    return 0;
}
```
