Assignment No. 5

A college admission portal allows students to update their profiles online. Design a student class that correctly assigns the submitted details to the respective data members, even when the input
variable names are the same as the class attributes.

```
#include <iostream>
#include <string>

using namespace std;

class Student {
private:
    int rollNumber;
    string name;
    string course;

public:
    // Constructor using initializer list and const reference for strings
    Student(int rollNumber, const string& name, const string& course)
        : rollNumber(rollNumber), name(name), course(course) {}

    // Member function to display student details
    void displayDetails() const {
        cout << "Student Details" << endl;
        cout << "Roll Number: " << rollNumber << endl;
        cout << "Name: " << name << endl;
        cout << "Course: " << course << endl;
    }
};

int main() {
    Student s1(101, "Anjali", "Computer Science");
    s1.displayDetails();

    return 0;
}
```

main.cpp

Run ▶

```
name(name), course(course) {}

    // Member function to display student details
    void displayDetails() const {
        cout << "Student Details" << endl;
        cout << "Roll Number: " << rollNumber << endl;
        cout << "Name: " << name << endl;
        cout << "Course: " << course << endl;
    }
};

int main() {
    Student s1(101, "Anjali", "Computer Science");
    s1.displayDetails();

    return 0;
}
```

Output

```
Student Details
Roll Number: 101
Name: Anjali
Course: Computer Science
```
