Assignment No. 6

An HR application creates employee records temporarily while processing recruitment data. Design an
Employee class that displays appropriate messages when employee records are created and automatically
removed from memory after processing is completed.

```
#include <iostream>
#include <string>

using namespace std;

class Employee {
private:
    int emp_id;
    string name;

public:
    // Constructor using member initializer list and const reference
    Employee(int id, const string& n) : emp_id(id), name(n) {
        cout << "Employee record created for " << name << endl;
    }

    // Display employee details (marked const since it only reads data)
    void display() const {
        cout << "Employee ID: " << emp_id << endl;
        cout << "Employee Name: " << name << endl;
    }

    // Destructor
    ~Employee() {
        cout << "Employee record removed for " << name << endl;
    }
};

int main() {
    // Creating an employee object
    Employee emp(101, "Anjali");

    // Displaying employee details
    emp.display();

    // Object is automatically destroyed when main() ends
    return 0;
```

}

main.cpp Run ▶

```
    }

    // Destructor
    ~Employee() {
        cout << "Employee record removed for " << name << endl;
    }
};

int main() {
    // Creating an employee object
    Employee emp(101, "Anjali");

    // Displaying employee details
    emp.display();

    // Object is automatically destroyed when main() ends
    return 0;
}
```

Output

```
Employee record created for Anjali
Employee ID: 101
Employee Name: Anjali
Employee record removed for Anjali
```
